

ShowBuz: steps before a first public release

Ship the iPhone app and this site as one product. The site currently advertises a download it cannot complete, and a few legal and auth paths are unproven. Do not do a public push until the items below are either fixed or explicitly accepted as known limits.

Do not launch until these work

1. A real App Store listing, and honest store buttons

The App Store and Google Play buttons both go to #download on this page, not a store. There is also a live contradiction: the site offers Google Play, while the FAQ says the app is iPhone-only and Android deps answer on WhatsApp. For v1, point App Store at the live listing and drop or relabel Play unless that build actually exists.

2. Email confirm and password reset on a real iPhone

/email-confirmed and /reset-password hand tokens into depbookv3://auth/callback. Test the full mail → Safari → Open ShowBuz path with the app installed and not installed. Custom URL schemes fail silently if the app is missing; Apple will also expect this to work for App Review.

3. GDPR opt-out for deps with no account

Privacy promises a form plus STOP / “opt out” on WhatsApp and SMS. The form currently posts straight at Supabase and skips the Next API that attaches the anon key, so it may 401 or fail CORS in production. Prove, with a real number or email:

- The form removes the dep from address books
- STOP on WhatsApp and SMS actually stops messages
- A chair cannot keep messaging that person through the app

That is a launch-blocker, not a polish item.

4. Legal entity and App Store privacy answers match

The footer is Mike Kearsy Limited. Privacy says the controller is ShowBuz. Terms say the app is provided by ShowBuz. Apple, the ICO, and a first user will treat those as the same question. Pick one legal name and use it on the site, in the App Store listing, and in the privacy nutrition labels.

5. The Guide is not shippable as-is

It is still uncommitted on main, Settings is undocumented, “email the week” was pulled because the taps were unknown, and chairs already caught a wrong path (add show is Settings, not Diary). Either finish it from real screens, or do not link it from the homepage until it is.

Bulletproof in the app (not the landing-page repo)

Run these with two real chairs and a dep who does not install the app:

- Add show in Settings → published dates appear in Diary
- Ask a dep from the night → WhatsApp, SMS or email actually arrives
- Dep taps Available / Unavailable only on WhatsApp → both diaries update
- Auto Book walks the list until the night is filled

- Auto reconfirm at 9:00am on show day, one tap for both shows
- Deps tab is the chair's list, and a dual-role user (chair + dep) uses one login
- Wrong or outdated schedule data: confirm the terms disclaimer matches what the app actually does
- Push, calendar, and Travel Assist: optional, permission-gated, and off if refused

If any of those fail in the wild, the homepage copy is false.

This site still needs hardening

Risk	Why it matters
Hydration error from the homepage scroll script in layout.tsx	Dev overlay already fired; can bite SEO and first paint
No robots.txt, sitemap, or Open Graph image	Shared links look unfinished
No tests or CI	Auth redirects and the opt-out route can regress unnoticed
Uncommitted Guide / Header / Hero work on main	Easy to deploy the wrong tree
Copy: "The show's already in your diary"	Chairs must add the show in Settings first

Also do a production check of /privacy, /terms, /guide, /email-confirmed and /reset-password on a phone, not only desktop.

Suggested order this week

1. App Store listing live; Play button gone or honest.
2. Confirm + reset password on device, app installed and not.
3. Opt-out form + STOP, end to end.
4. Legal name aligned everywhere.
5. Two-chair / one-WhatsApp-only-dep rehearsal of the booking loop.
6. Either finish the Guide from screenshots of Settings, or unlink it.
7. Then announce — soft launch to a handful of chairs before any public push.

Treat a small invited group as the first release, not a press or social blast, until WhatsApp replies and opt-out have survived a real week of shows.
